

Oklahoma's Watershed Dams Located Within the Wichita-Caddo-Delaware Nation

Sugar Creek Watershed Dam No. 9
Caddo County, Oklahoma

Oklahoma has 129 watershed projects sponsored by local units of government such as conservation districts and municipalities.

Local watershed project sponsors with the assistance of the USDA Natural Resources Conservation Service (NRCS) have constructed 2,107 flood control dams in 61 counties to reduce flooding, control erosion and sediment, improve fish and wildlife habitat, improve water quality and in some cases provide recreational areas and municipal water supplies. Of these, 74 dams are located within the Wichita-Caddo-Delaware Nation.

Several dams are usually constructed in a watershed to trap rainfall and slowly release it through pipes in the dams preventing flooding downstream.

Watershed projects sponsors and NRCS have also worked with landowners to help them install thousands of conservation practices to help control erosion and sediment.

Watershed projects have established a \$2 billion infrastructure that provides \$94 million in average annual benefits from reduced flood damage and other benefits.

Dams in the Wichita-Caddo-Delaware Nation provide an estimated \$3.3 million in annual benefits. The flood control dams provide flood protection for houses, businesses, roads and bridges, and productive farmland.

There are six flood control dams within the Wichita-Caddo-Delaware Nation that have been planned but not yet constructed (see map on back page).

Some of these planned dams have not been constructed due to land right issues, land use changes and lack of federal and local funding.

The NRCS provides planning, design and construction of the dams through the USDA Watershed Program. Federal funds for the program are appropriated by Congress.

Local project sponsors provide land rights and easements and are responsible for the operation and maintenance of the dams.

High Hazard Dams

There are 260 watershed dams that are classified as high hazard dams, which means if the dams should fail, there could be loss of life downstream. There are seven high hazard dams located within the Wichita-Caddo-Delaware Nation. (see map on back).

Rehabilitation of Aging Dams

Many dams today are in a far different setting than when they were constructed. Population has grown, homes and businesses have been constructed upstream and downstream from the dams; land uses have changed; sediment pools have filled; and concrete and metal components have deteriorated.

Many dams in Oklahoma do not meet current dam safety regulations due to the adoption of more stringent requirements after the dams were built.

Rehabilitation to meet current safety standards usually requires raising the height of the dam, replacing the principal spillway inlet and conduit and widening the earthen auxiliary spillway.

Thirty-six dams have been rehabilitated with two of these located in the Wichita-Caddo-Delaware Nation. (see map on back).
